Exploratory Testing

This document contains test session sheets documenting session-based exploratory testing of SauceDemo's login, shopping cart, checkout process, and product sorting functionality.

Test Session Sheet 01 - LOGIN

Test Charter - Explore login behavior, focusing on *unusual inputs* and *authentication behavior*.

Timebox - 60 minutes

Session notes

- After an unsuccessful login attempt, the error icon overlaps with the password visibility icon. Clicking the error message's "X" removes the error icon, but the password visibility icon remains unavailable for subsequent attempts.
- Username and password fields have no apparent character limit (tested by pasting approximately 215k characters).
- The login session expires after a period of inactivity
    - Observed on cart.html and checkout-step-one.html.
    - After expiration, interacting with an interactive element logs the user out.
    - Error message: "Epic sadface: You can only access '/checkout-step-one.html' when you are logged in."
    - Refreshing or hard-refreshing the page does not immediately log the user out.
- After logging out, protected pages cannot be accessed. However, using the browser's Back and Forward buttons or closing and reopening the tab may allow access to a previously viewed protected page.
    - Potential defect in session or authentication handling.
    - Reproduced by logging in, clicking Back, then clicking Forward.
- No apparent restriction on repeated unsuccessful login attempts.
    - Potential security concern: may increase vulnerability to brute-force attacks.

Findings

- The password visibility icon becomes unavailable after an unsuccessful login attempt.
- Username and password fields have no apparent character limit.
- The login session expires after a period of inactivity.
- Previously viewed protected pages may remain accessible through browser navigation without explicitly signing out.
- No apparent restriction on repeated unsuccessful login attempts.

Test Session Sheet 02 - CART

Test Charter - Explore cart behavior, focusing on the *Add to cart* and *Remove features*, as well as *cart contents*.

Timebox - 60 minutes

Session notes

- Unable to increase an item's quantity. The QTY field appears editable but is not interactive.
- Ctrl-clicking the cart link does not open the cart page in a new tab, although Ctrl-click works on other links on the site.
- Users can access checkout and complete an order with an empty cart.
- The description label on the cart page is unusually positioned.
- The Sauce Labs Onesie product description contains a possible typo: “hemmed sleeved and bottom.”
- The product-name hyperlink’s hover area extends beyond the product’s text, making the product name more difficult to select and copy.
- The cart page does not provide a “Clear Cart” button.
- The cart page does not display an order total
    - The total appears on the Checkout: Overview page.”

Findings

- Quantity (QTY) UI elements appear editable but are not interactive.
- Ctrl-click does not open the cart page in a new tab. Ctrl-click works on other links on the site.
- Users can access the checkout page and complete an order with an empty cart.
- The description label on the cart page is unusually positioned.
- Sauce Labs Onesie’s product description contains a possible grammatical error: “hemmed sleeved” should be “hemmed sleeves.”
- Product-name hyperlink hover area extends beyond the displayed text, making text selection and copying more difficult.
- The cart page does not provide a “Clear Cart” button.
- The cart page does not display an order total. The order total is shown at Checkout: Overview.

Test Session Sheet 03 - CHECKOUT

Test Charter - Explore checkout behavior - focusing on *input validation* and *order completion*.

Timebox - 60 minutes

Session notes

- Refreshing the order confirmation page removes the “Generate PDF order” button.

- Checkout fields accept any nonblank input, including letters, special characters, and spaces.
- Can complete an order with an empty cart.
- Ctrl-click on the "Checkout" button - opens in the same tab.
    - Same with “Continue” and “Finish” buttons.
- Clicking a product name on the Checkout page opens its Product Detail Page (PDP), where the product can be removed from the cart.
    - The Checkout page does not provide a “Remove” button, unlike the Cart page.
    - The PDP has no on-page navigation back to Checkout; “Back to Products” returns to the PLP.
- From the checkout page, Cancel takes to the PLP (Home page).
- The order confirmation PDF uses the device’s date and time, even when the device’s clock is incorrect.
- Order completion PDF has “Items Description” label and only product names are listed, no product descriptions.

Findings
- Users can complete an order with an empty cart.
- The “Generate PDF order” button disappears after refreshing the order confirmation page.
- Checkout fields accept any nonempty input.
- Ctrl-click does not open “Checkout”, “Continue”, and “Finish” buttons in a new tab. Ctrl-click works on other links on the site.
- A product can be removed from the cart during checkout by opening its PDP and using the “Remove” button.
- Product Detail Page provides no direct way to return to Checkout; “Back to Products” returns to the PLP.
- Clicking the “Cancel” button returns the user to the PLP (Home page).
- The order confirmation PDF uses the device’s date and time, even when the device’s clock is incorrect.

Test Session Sheet 04 - SORTING

Test Charter - Explore product sorting behavior, focusing on *sorting options* and *sort order*.

Timebox - 30 minutes

Session notes
- Name sorting: The product naming convention is inconsistent.
    - All products begin with “Sauce Labs” except “Test.allTheThings() T-Shirt (Red).”
    - Only one product includes a color in its name.

- Name sorting provides limited benefit because most product names follow the same naming pattern - product names starting with “Sauce Labs”.
- Clicking a product’s detail page and returning back to PLP, the sort option resets to the default “Name (A to Z)” sort.
- Refresh resets the sort back to “Name (A to Z)”
- UI functionality: Clicking the down arrow on the sort dropdown does nothing - the rest of the box is clickable.
- These are sorting options, but there is a filter icon.
- A filter feature may be more useful than sorting for browsing products on an e-commerce site

Findings

- Inconsistent product naming — “Test.allTheThings() T-Shirt (Red)” does not follow the “Sauce Labs” naming pattern, which may make it harder to locate when browsing products alphabetically.
- Sort selection resets when returning from a product’s details page.
- Sort selection resets after refresh.
- Clicking the down-arrow icon on the sort dropdown does not trigger the dropdown options.
- The sort dropdown displays a filter icon instead of a sort icon.
